PROJECT OVERVIEW

The City of Hamilton has retained GreenTech Engineering (GreenTech) to complete the design and consultation for the Fruitland Vertical Farm and Marketplace located at the intersection of North Service Road and Fruitland Road in Stoney Creek, Ontario. The City of Hamilton's 2031 Master Plan (2015) identifies the need for sustainable infrastructure, with the goal of implementing innovative solutions for the problems threatening today's society. To fulfill this need, the City has chosen to implement a vertical farm in a community slated for urban development in the coming years.

The objective of the Fruitland Vertical Farm and Marketplace is to provide an alternate means of food production in a population-dense environment. The proposed undertaking will seek to act as a "sustainable landmark" within the City of Hamilton by implementing sustainable structural, stormwater, transportation, and geotechnical practices throughout its design and construction.

TABLE OF CONTENTS

7.1 DESIGN APPROACH

Greentech Engineering recognizes the importance of enhancing the triple bottom line of our stakeholders being people, planet, profit and these concepts are reflected in our design approach. People are at the core of Greentech Engineering as we focus on safety, ease of construction and familiar structural design to decrease the chances of errors. All member loads are calculated conservatively to ensure the safety and proper serviceability of the occupants and workers. Sustainability is at the core of Greentech Engineering services and it is also at the core of the project, Fruitland Vertical Farm and Marketplace and this too was an important factor in the overall design. Although it is important to be conservative and have built-in redundancy into our structural system, our engineers also recognize that the more material used, the more embodied carbon will be part of the project. It is our aim to design the connections efficiently – for instance our decision to design connections for different pair of structural members, which reflect our aim to decrease the material used in the structural system. With an aim to decrease material naturally follows savings which increase profit and increasing the overall value of the project for developers. The connections were first manual design using Handbook of Steel Design Construction CSA S16-14, and then import to IDEA Statica for sufficient checks. Structural framing members were selected from ASTM Grade A992 steel, while connection members were selected from CSA G40.21 Grade 300W steel. Bolt assembly used in the project is A325 with F_u of 825 MPa, and matching electrode weld E49xx with X_u of 490 MPa.

7.2 JOIST – GIRDER CONNECTIONS DESIGN

7.2.1 Joist – Girder Connections Design Overview

The goal of joist to girder connection is to design to transfer shear from joist to girder, but not moment. In the other word, the connection allows certain degree of rotation, but must be restrained any lateral movements. According to CSA S16-14, one of the connection methods that matching all these criteria is shear tab. In this project, there are two type of shear tab connections were designed for Exterior joist – girder connection and Interior joist – girder connection.

7.2.2 Exterior Joist – Girder Connection

In this type of connection, two structural members were connected through double angle sections. Angle sections were attached to the webs of structural members using ¾ inch bolts. This would allow the rotation of top and bottom flange of supported member, but also prevent the movements in any direction. Figure 1 shows a typical Exterior joist – girder connection.

The design was repeated for different combination of structural members:

Level	Joist Section	Girder Section	Angle Section	Bolt Size
2nd Floor	W310x45	W460x89	L76x76x7.9	¾ inch
3rd Floor	W310x45	W460x89	L76x76x7.9	¾ inch
4th Floor	W310x45	W460x89	L76x76x7.9	¾ inch

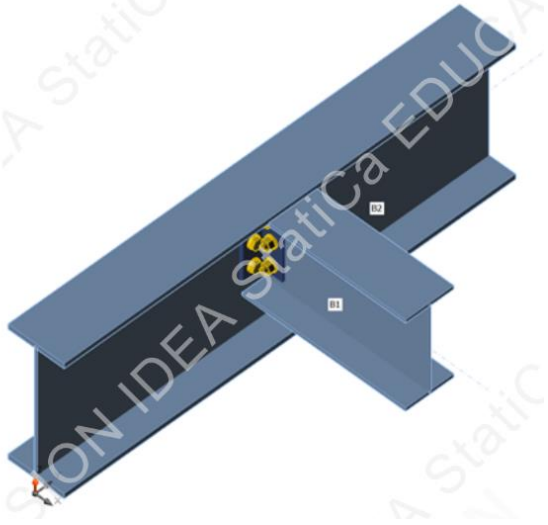

Figure 1: Typical Exterior Joist - Girder Connection

7.2.3 Interior Joist – Girder Connection

In this type of connection, two structural members were connected through double angle sections. Angle sections were bolted to supported member using ¾ inch bolts and welded to supporting member. This would allow the rotation of top and bottom flange of supported member, but also prevent the movements in any direction. Figure 2 shows a typical Interior joist – girder connection.

The design was repeated for different combination of structural members:

7.3 BEAM – COLUMN CONNECTIONS DESIGN

7.3.1 Beam - Column Connections Design Overview

Similar to joist – girder connection, shear tab was also designed for beam – column connection. However, it is noted that at one column location, two types of shear tab are connected to the same column, namely girder – column connection and joist – column connection.

7.3.2 Girder – Column Connection

In this type of connection, two structural members were connected through double angle sections. Angle sections were attached to the web of joist and web of column using ¾ inch bolts. This would allow the rotation of top and bottom flange of joist, but also prevent the movements in any direction. Figure 4 shows a typical Joist – column connection.

The design was repeated for different combination of structural members:

Level	Girder Section	Column Section	Angle Section	Bolt Size
2nd Floor	W310x45	W200x52	L76x76x7.9	¾ inch

7.3.3 Joist - Column Connection

In this type of connection, two structural members were connected through double angle sections. Angle sections were attached to the web of girder and flange of column using ¾ inch bolts. This would allow the rotation of top and bottom flange of girder, but also prevent the movements in any direction. Figure 3 shows a typical Girder – column connection.

The design was repeated for different combination of structural members:

7.4 CHEVRON BRACE CONNECTIONS DESIGN

7.4.1 Chevron Brace Connections Design Overview

The chevron bracing connection requires the most detail in comparison to the other connections within the Fruitland Vertical Farm and Marketplace building. The channels for the bracing are changed at each level and thus an easily detailed connection which can be replicated with ease for the contractors is required. Taking advantage of offsite construction, endplates are welded onto the ends of channel and plates sized 300x200x10 are then fillet welded concentrically to the end plate in order to straddle the gusset plate. There are two connections which require detailing; one which is the top chevron connection which has one gusset plate supporting the

loads from two channels and the second connection is the single channel connecting to a gusset plate which is welded to a column and a baseplate or beam.

7.4.2 Chevron Brace Connection

A summary of the tensile loads and connections are provided in Table 5 below. A design for the largest load was conducted and the same design was implemented at each level. A design check was still required at each level to ensure the connection was still sufficient because a smaller channel was used and thus there was a smaller weldable area.

Level	Load (CF/TF)	Member	Bolt	Weld Size
1ST FLR	Tf=701 kN	C200X28	7/8 inch	10mm
2ND FLR	Tf=533 kN	C200X21	7/8 inch	10mm
3RD FLR	Tf=374 kN	C180X15	7/8 inch	10mm
4TH FLR	Tf=177 kN	C180X15	7/8 inch	10mm

Table 5: Chevon Brace Connection Summary

Figure 5 below shows a typical chevron bracing connection. For sample calculation and IDEA Statica results, refer to Appendix C.

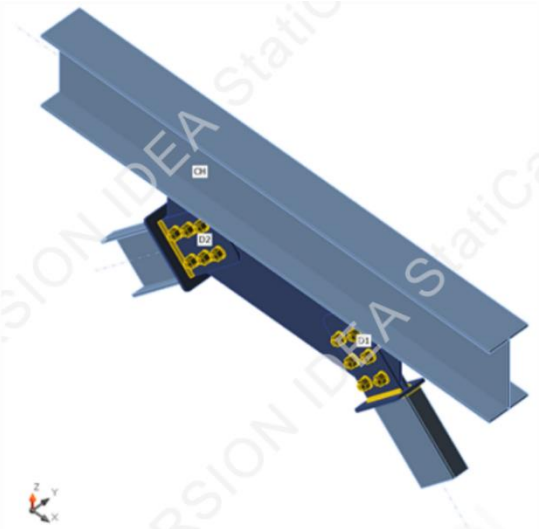

Figure 5: Typical Chevron Brace Connection

It is also important to note that the singular channel connection to the gusset plate which occurs on the channel is the same as the connection seen in Figure 5 above. The only exception is that the gusset plate is welded to the column and the adjacent beam or baseplate. Details for the connection can be seen in the structural detail drawings.

7.5 COLUMN SPLICE CONNECTIONS DESIGN

7.5.1 Column Splice Connections Design Overview

In an effort to lower the embodied carbon emissions of the project GreenTech engineers changed the size of the column at each level. A connection between these two columns is required. In reality, this connection doesn't require much engineering as it consists of two plates welded to the ends of both connecting columns and then 4 anchors holding these plates together. There is no moment or shear coming to these columns and solely compressive load and thus as long as the two 10mm thick plates can avoid crushing, the connection is sound. Regardless, an analysis and calcs were performed on the connection to ensure it was safe and to assess the tensile capacity of such a connection.

7.5.2 Column Splice Connection

A splice connection consisting of endplates anchored together was required for this splice because of the different sized columns coming together. Typically what may be seen between columns of the same size are splice plates anchored on each side of the web and at the exterior of each flange but this would not be practical in this scenario. Table 6 below shows a summary of the loads and the connection designed for the splice plates.

Where Largest Load Occurs	**Load (CF/TF)**	**Member(s)**	**Bolts**	**Welds**
COL TO COL @J8	Cf=927 kN	W200X42 TO W200X52	¾ inch	10mm
COL TO COL @J8	Cf=1453 kN	W200x52 TO W200X71	¾ inch	10mm
COL TO COL @J8	Cf=1948 kN	W200X71 TO W200X86	¾ inch	10mm

Table 6: Column Splice Connection Summary

Figure 6 shows a typical isometric view of this connection.

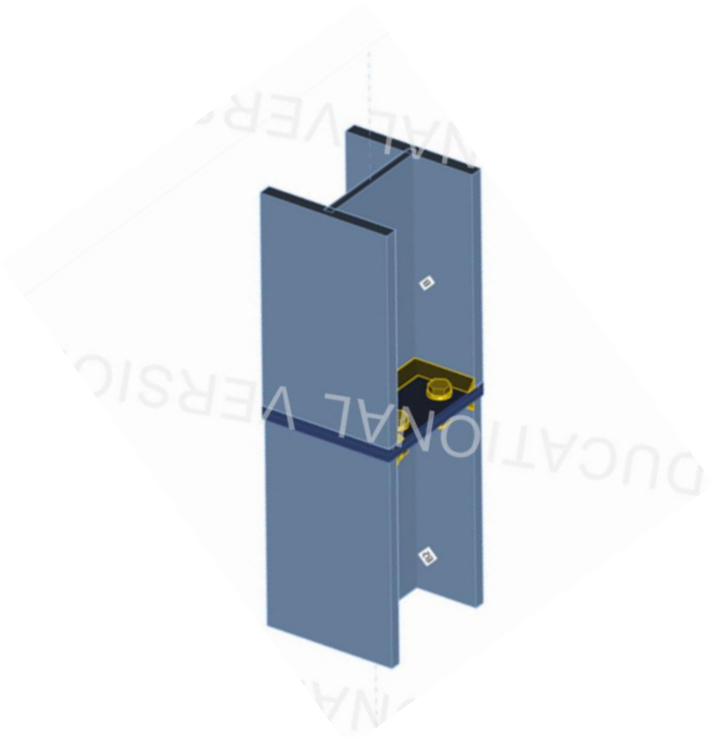

Figure 6: Typical Column Splice Connection

For sample calculation and IDEA Statica results, refer to Appendix C.

7.6 BASED PLATE CONNECTIONS DESIGN

7.6.1 Base Plate Connections Design Overview

Base plate connection is similar to that of the column splice connection in that it is mainly governed by compression. Detailed calculations were followed from the CISC handbook and this can be seen in Appendix C. Like the column splice connection, a base plate is welded onto the column end off site and is then brought to site to be anchored into the foundations (which is out of scope for GreenTech Engineering). Four ¾" anchors are sufficient and standard for all baseplates within this project.

7.6.2 Base Plate Connection

The base plates were designed based off of the column with the largest load. Each column is a W200 section and thus the layout of the anchors and the column relative to the perimeter of the baseplate remains consistent between each column. The only time a base plate changes in length is when a chevron brace is to be welded to it in which case additional base plate is required to

ensure that the 300W 300x300x10 gusset plate for the chevron brace can be welded onto a steel surface. A summary of the loads and connections can be seen in Table 7 below.

Where Largest Load Occurs	Load (CF/TF)	Members	Bolts	Welds
W200X86 @ J8	Cf=1948 kN	W200X86	¾ inch	10mm
W200X52 @ J4	Cf=1205 kN	W200x52	¾ inch	10mm
W200X42 @F2-1	Cf=434 kN	W200x42	¾ inch	10mm

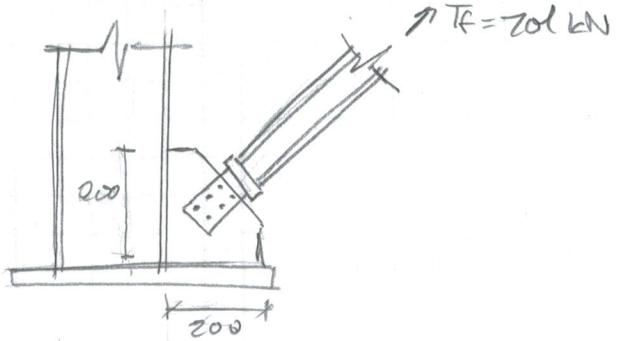
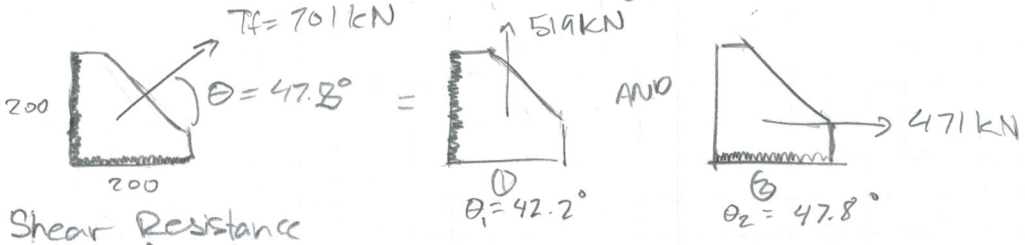
Chevron Bracing - Single Gusset Plate

- All connections for this were checked in the previous chevron bracing analysis except for the connection between the gusset plate and the column or baseplate / beam.





Shear Resistance

① $M_w = 1$ for both

$$V_{r1} = 0.67 \phi_w A_w X_u (1 + 0.5 \sin^{1.5}\theta) M_w$$

- NOTE: length of weld leg is 10mm so throat is 7.1 mm
  Using E49xx

$$V_{r1} = 0.67 \times 0.67 \times (2 \times 200 \times 7.1)(490)(1 + 0.5 \sin^{1.5} 42.2) \times 1$$
$$= 796\ kN > 519\ kN$$
$$V_r > V_f \quad \checkmark OK$$

$$V_{r2} = 0.67 \times 0.67 \times (2 \times 200 \times 7.1)(490)(1 + 0.5 \sin^{1.5} 47.8) \times 1$$
$$= 823\ kN > 471\ kN$$
$$V_r > V_f \quad \checkmark OK$$

I also need to check to see if the baseplate / anchors need to be checked for tension.

↳ As seen above the baseplate faces an uplift of $1.4W = 519\ kN$ at most

↳ Referring to the column design chapter, the dead load on a column with the gusset is 383.1 kN (unfactored dead)

↳ Total uplift is $1.4W + 0.9D = 519 - 0.9 \times 383.1$
$= 174\ kN$

Referring back to the baseplate hand calculation section

↳ Tensile resistance for 1 bolt = 88.6 kN
so for 4 bolts $T_r = 88.6 \times 4 = 354.4\ kN > 174\ kN$

↳ Conc. pryout resistance = 479.4 kN > 174 kN

∴ the designed connection for the gusset plate and base plate is sufficient.

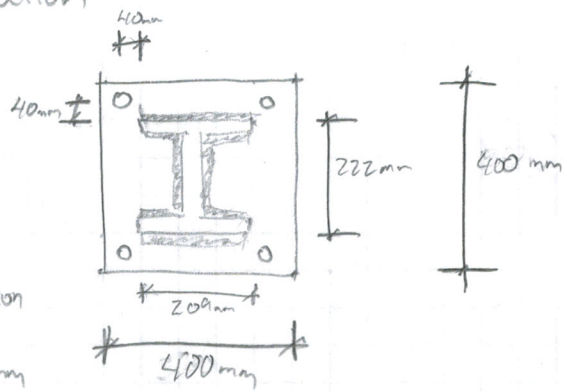
COLUMN BASEPLATE

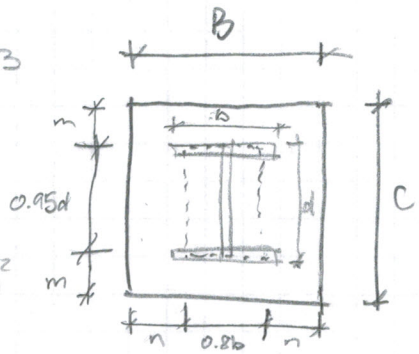
- The column, W200×86, with a load of 1948 kN will be used to demonstrate the validity of the chosen baseplate.
- Dimensions of Baseplate recommended were 369×382 mm
  ↳ we will round this up to 400×400 for our actual design for ease of construction

NOTE:
- anchors are 16 A325M with a length of 300mm
- Welds are 10mm in length giving a Th = 7.1mm
- Plate is 30mm thick
- anchors are 40mm in each direction away from corner of column
- Total offset from column is 80mm in each direction



Following instructions in S16-14 p4-153 S16-14 p.4-153

$d = 222$mm $b = 209$ mm
$B = 369$mm $C = 382$ mm
$m = 85$ mm $n = 100$ mm
$F_y = 300$ MPa $\phi = 0.9$



$$t_p = \sqrt{\frac{2 C_f n^2}{B C \phi f_y}} = \sqrt{\frac{2 \times 1948000 \times (100)^2}{400 \times 400 \times 0.9 \times 300}}$$

$= 30$ mm

Plate design summary is 400×400×30
↳ this plate will be used for all columns for ease of construction and costs
↳ all columns are W200 so it makes sense to keep these dimensions

Anchors for baseplate tensile resistance
↳ no tension is applied to baseplate due to a high gravity compression.
↳ Resistance calculations will be done to show capacity.

- Anchor tensile resistance

CSA A23.3 14-D.6.1

N_{sar} = steel strength of anchor in tension
$= A_{se,N} \times \phi_s \times f_{uta} \times R$ $\quad A_{se,N} = 157 mm^2$ $\quad R = 0.8$
$= 157 \times 0.85 \times 830 \times 0.8$ $\quad \phi_s = 0.85$
$= 88.6 kN$ $\quad f_{uta} = 830 MPa$

- Concrete Pryout Resistance

CSA A23.3 -D.7.3

$V_{cpr} = k_{cp} \times N_{cpr}$ $\quad k_{cp} = 2$ (Conc. pryout factor)
$= 2 \times 239.7$ $\quad N_{cpr} = 239.7 kN$
$= 479.4 kN$

Welds for the baseplate don't require checking as the only force is in compression. For weld resistance please refer to the IDEASTATICA reports.

Column Splices

3 types of splices where section switches
- W200×42 to W200×52
  W200×52 to W200×71
  W200×71 to W200×86

These columns all undergo compression and do not have any lateral force transmitted to it.

There is no gap between columns so ℰ29.3.9 is satisfied — S16-14 ℰ29.3.9

For sample calculations the greatest compressive load for a splice will be used which is W200×71 to W200×86 w/ $C_f = 1948$ kN

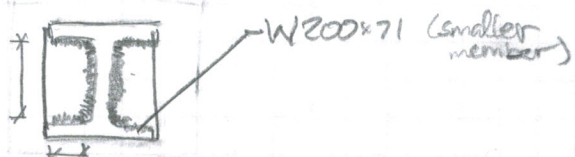
Welds

Cl 13.13.2.2

- Again, no shear force applied to weld so no checks are really required
- For the sake of finding the capacity of the connection an analysis is conducted
- Weld to check;

↳ $T = 148\,mm$ $T < 2a$ ↳ more critical

$2a = 196\,mm$



total length of weld in more critical direction is

$2T = 2 \times 148 = 296\,mm$

↳ NOTE: IDEASTATICA under represents this value

T_h = weld throat width (our weld is 15mm)

$= 1030\,kN$

$\theta = 90$ $\sin 90 = 1$

$X_u = 490\,MPa$ → electrode is E49xx

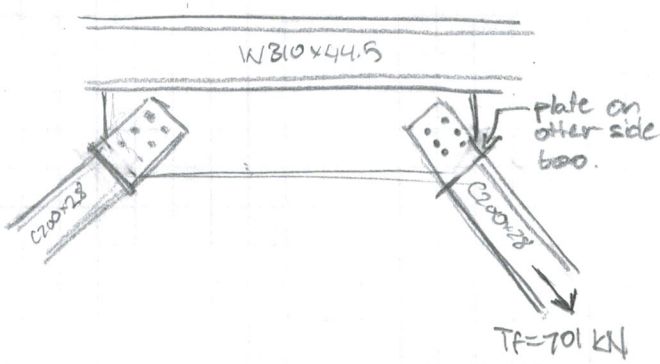
$\phi_w = 0.67$

→ Welds and Bolts are very conservative and are mainly here to bring columns together.

CHEVRON BRACING

Design:

↳ NOTE: Design is tension only bracing, therefore if I design one connection for full load the other connection will also be okay.



↳ Here, the design for the chevron bracing on the bottom floor is done and compared to results in IDEASTATICA
↳ This connection is checked through IDEASTATICA for all levels to ensure it works.

BOLT CHECKS

- Tension Resistance — S13.12.1.3

$T_r = 0.75 \phi_b A_b F_u$ $\phi_b = 0.8$ $A_b = 314 mm^2$ $F_u = 830 MPa$

$= 0.75 \times 0.8 \times 314 \times 830$

$= 156.4 kN$

→ From FEA in IDEASTATICA $T_f = 14.6 kN$ although it is essentially zero following load paths

- Shear Resistance — S13.12.1.2

$V_r = r_{st} \times 0.6 \times \phi_b \times A_b \times F_u$

$r_{st} = 0.7$ because shear plane intercepts threads

$V_r = 0.7 \times 0.6 \times 0.8 \times 314 \times 830$

$= 87.6 kN$

$V_f = \frac{701}{6} \times \frac{1}{2}$ (2 shear planes) $= 60 kN$ ← IDEASTATICA overestimates this slightly for some bolts

$V_r > V_f$ ✓OK

- Bearing Resistance — S13.12.1.2

$B_r = 3 \phi_{br} t d F_u n$ $\phi_{br} = 0.8$ $t = 10mm$ $d = 20mm$ $F_u = 450 MPa$ $n = 6$

$= 3 \times 0.8 \times 10 \times 20 \times 450 \times 6$

$= 1296 kN$ ← value differs in IDEASTATICA, they look at individual bolt

$V_f = 701 kN$

$B_r = 1296 kN > V_f = 701 kN$

- Interaction of Tension & Shear Check
  - ↳ Tension is negligible in this case (really no tension despite IDEASTATICA's check).
  - ↳ thus connection will pass as $V_f/V_r < 1$

③ $T_r = 0.75\left[1200\times345 + 0.6\times2400\times\left(\frac{400+350}{2}\right)\right]$
$= 715.5\,kN$

$T_r = 414kN > 351\,kN$ ✓ok

- Bolt Slip (Serviceability)
  ↳ none are considered slip critical joints

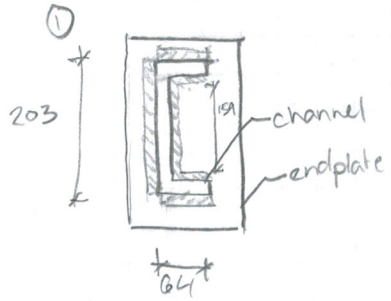
§13.12.2.2

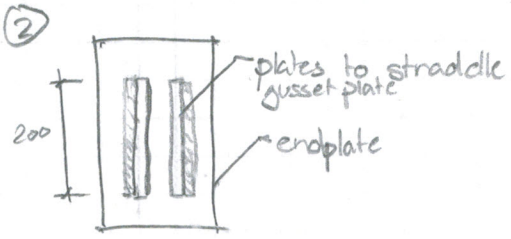
→ In closing, the chevron bracing connection for bolts works and the IDEASTATICA calculations are appropriate and more conservative and thus will be used to check other levels

Welds for Chevron Bracing

↳ There are 2 main welds on first look
1. The C-section welded to an endplate
2. The endplate welded to 2 other plates to straddle the gusset plate

NOTE: welds are hatched





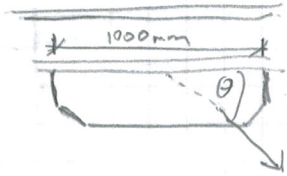
A conservative estimate of weld length for ① is $L = 203 + 159 + 64 \times 2 = 490\,mm$
For ② the total length of weld is $L = 200 \times 2 = 400\,mm$
↳ therefore I only need to check ②'s connection

- Weld resistance check
  ↳ load is perpendicular to welds
  ↳ total load is still 701 kN
  ↳ welds are 10mm w/ $T_h = 7.1\,mm$

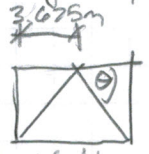
$T_r = \phi_w A_n F_u$ where $A_n = b \times t_{net} = 2 \times 200 \times 10 = 2840\,mm^2$ — Cl 13.13.3.2
$= 0.67 \times 2840 \times 440$
$= 837\,kN$
$\phi_w = 0.67$ $F_u = 440\,MPa$
$T_f = 701\,kN$
$T_r > T_f$ ✓ok

↳ There is also a third weld to consider which is the gusset plate to beam.

③



Elvn of bay



$\theta = \tan^{-1}\left(\frac{4}{3.625}\right) = 47.8^\circ$

Tension perpendicular to weld
$T_{fy} = 701 \sin(47.8) = 519.3\,kN$
$T_r = \phi_w A_n F_u$ where $A_n = b \times t_{net} = 2 \times 1000 \times 10 = 20\,000\,mm^2$
$= 0.67 \times 20000 \times 440$
$= 5896\,kN >> T_f = 519.3\,kN$ ✓ok

Shear resistance of weld ③

$V_r = 0.67 \times \phi_w \times A_w \times X_u \times (1 + 0.5 \sin^{1.5}\theta) M_w$

$\phi_w = 0.67$ $M_w = 1$ (single orientation)

$\theta = 47.8°$

$X_u = 490\ MPa$

$A_w = 2 \times 1000 \times 7.1 = 14\,200\ mm^2$

$= 0.67 \times 0.67 \times 14200 \times 490 (1 + 0.5 \sin^{1.5} 47.8)$

$= 4120\ kN$

$V_f = 701 \cos(47.8)$

$= 471\ kN$

$V_r > V_f$ ✓ok
